

## 30V 100mA Low DropOut Voltage Regulator

### General Description

The JY78L05 three terminal positive regulators is available with 5V fixed output voltage, making it useful in a wide range of applications. Used as a Zener-diode and resistor combination replacement, the JY78L05 usually provides an effective output impedance improvement of two orders of magnitude and lower quiescent current. These regulators can provide local, on-card regulation, eliminating distribution problems associated with single-point regulation. The available voltages allow the JY78L05 to be used in logic systems, instrumentation, HiFi, and other solid-state electronic equipment.

The JY78L05 is available in the plastic TO-92 package, SOT89-3 package, SOT23-3 package, and SOP8 package. With adequate heat sinking, the regulator can deliver 100-mA output current. Current limiting is included to limit the peak output current to a safe value. Safe area protection for the output transistors is provided to limit internal power dissipation. If internal power dissipation is too high for the heat sinking provided, the thermal shutdown circuit prevents the IC from overheating.
